General Information

For information on starting VAMIX and the basics of VAMIX, refer to the README.txt included in the original VAMIX .zip file.

The VAMIX system does not operate on non-Linux systems and requires the avconv library and java capability on the computer running this application.

This user manual will guide you through the different buttons and operations this tool can complete. This will explain what each button/text area/other is and will explain its basic operation, and also explain the purpose of each panel. Each panel can only complete one action at one time, so you can complete multiple operations across multiple panels at one.

In case of failure

If failure of VAMIX has occurred, such as it created a broken file, try to run the process again. If this does not create a valid file, please refer to the correct section of this manual.

If the VAMIX system crashes, please restart VAMIX and try the process again. This may be a computer fault and not a VAMIX system fault.

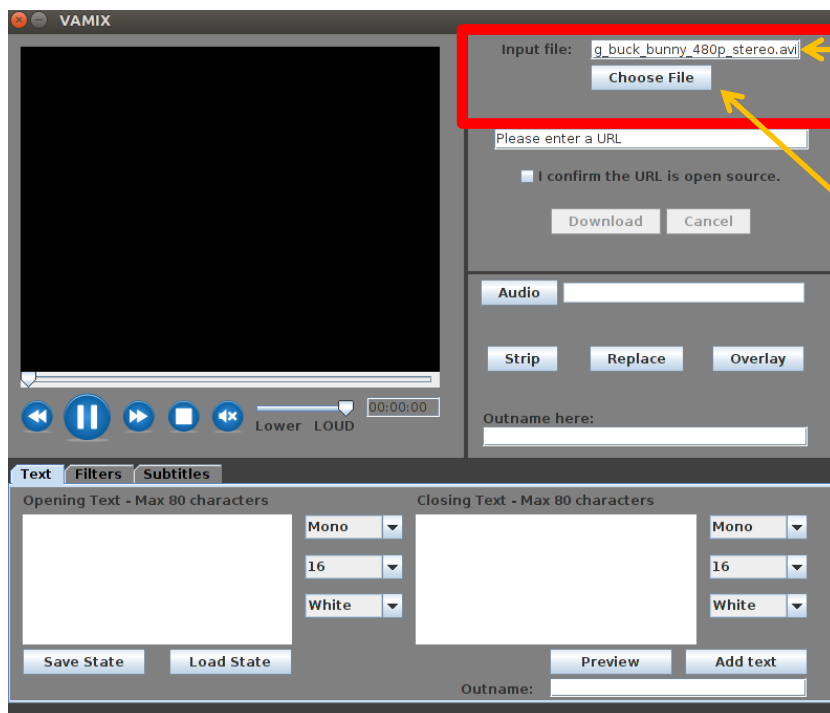

If you cannot find the answer to your problem in this manual or the README.txt file, then refer to the final section of this User Manual.

Open Panel

The open panel is there to open a file from your computer. It is best that the file is in the same location as the VAMIX.jar as this will be where output files are also saved. The file selector will pop up, and the file selected will be put into the play window ready to play/pause etc... There will also be the text of the file name displayed after entry.

Possible issues

This VAMIX system was mainly created for .mp4 files and similar, so you may come across some file types that are not accepted yet are video files. We are sorry for this, but it is an issue with strange file types.

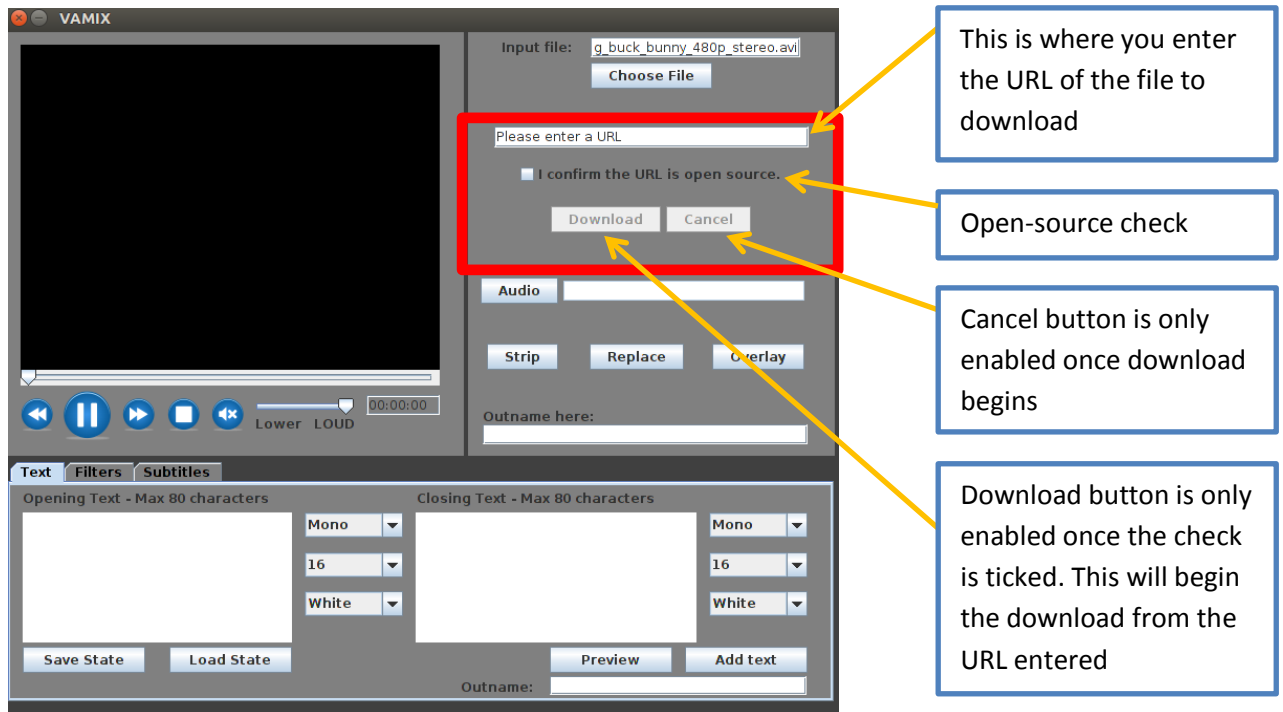

Not editable, but shows the name and location of the file input

Click this button to open the file chooser to select file to work with

Download Panel

Download panel allows downloading of files from the web. The name but be entered perfectly, and the file must be open-source, where you cannot click the download button without checking the check box saying the file is open-source. Enter text into the text area which should be the URL of the file. Then check the box saying open-source (ONLY IF IT IS OPEN-SOURCE). Then you can download, and cancel the download if needed.

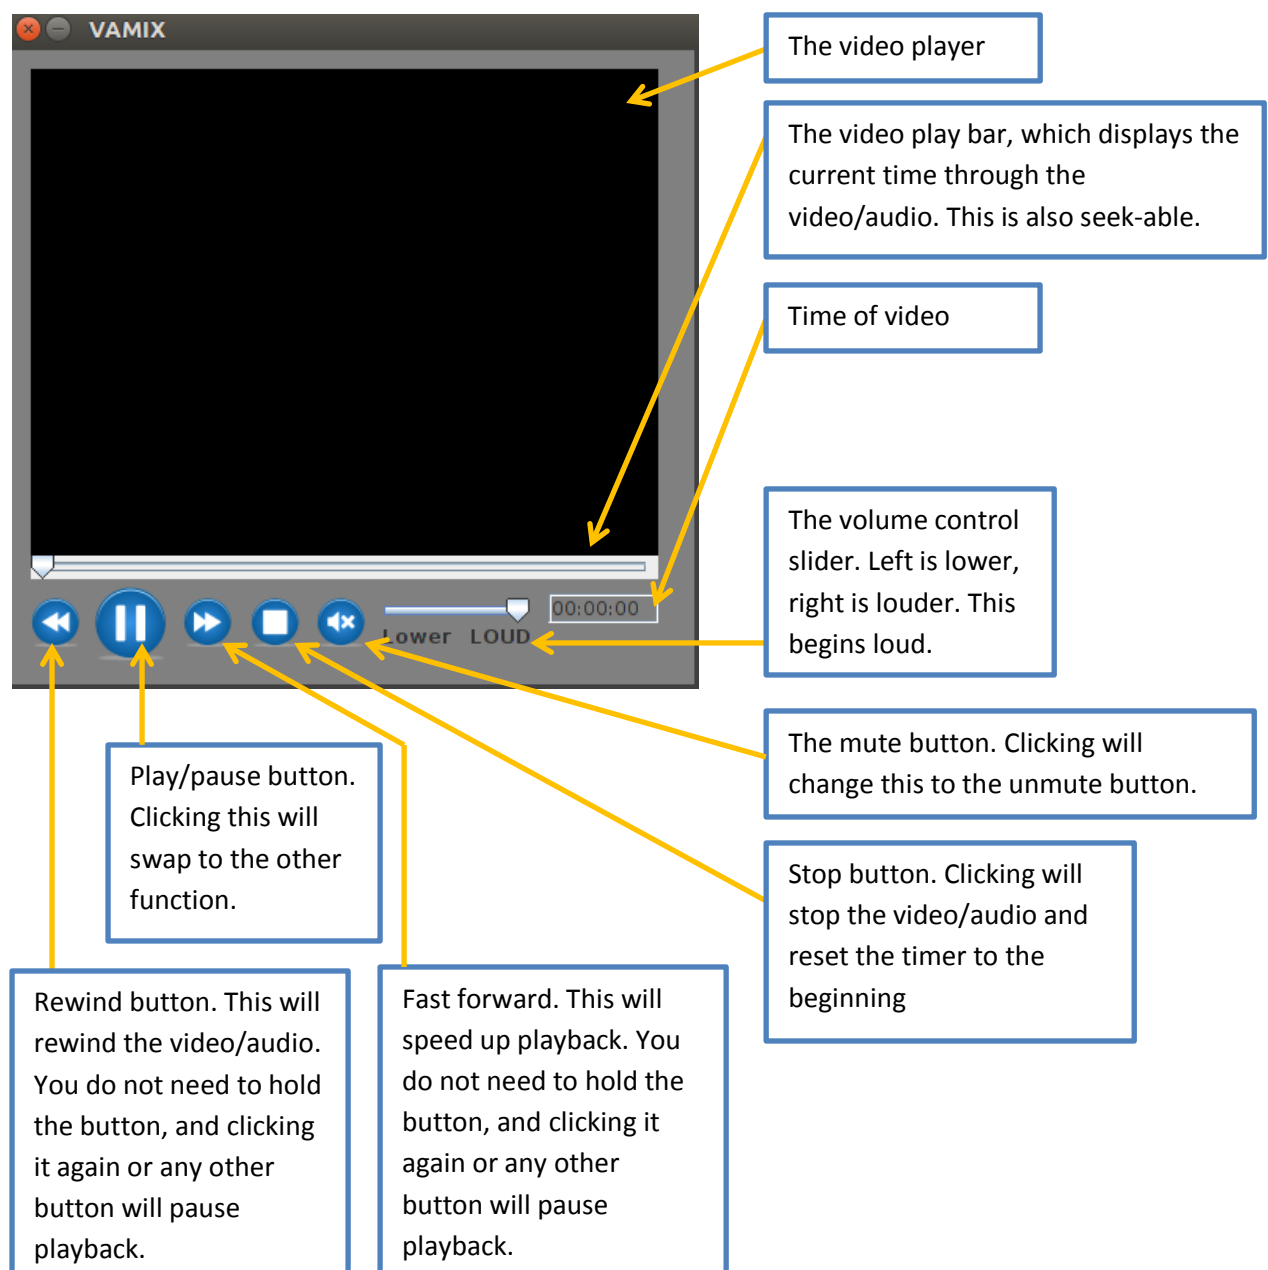

Play Panel

This panel is where the video is played, and where the buttons for playing the video are. These buttons also are used for when audio is played. The Open Panel is where the file to play is chosen, which automatically loads into this area.

Possible issues

It is known that there are minor bugs with the play/pause when starting a video. The system pauses when a video is entered a large majority of the time but will sometimes play straight away. This is unknown as to why, but should not cause any major issues.

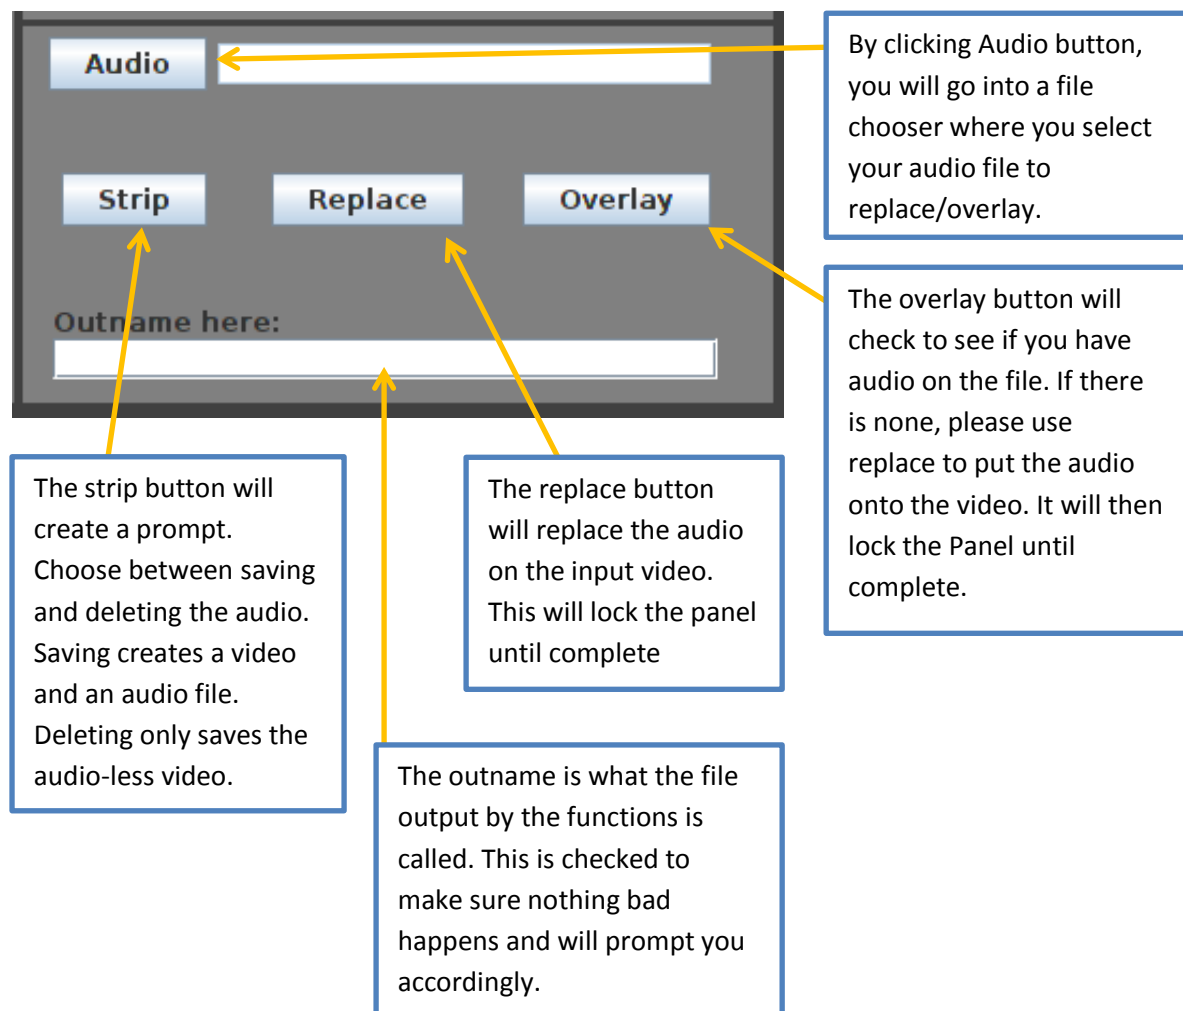

Audio Panel

This panel allows you to enter an audio file to overlay/replace the audio of the input file with. The strip function does not require an audio file input. You must also put in an output name for the file which is created by the options you select. The file will be saved to the same location as the VAMIX.jar file. If the outname defined is of a name that exists already, the system will prompt you to choose to overwrite the file, or choose another name. It also will make sure you do not overwrite the file you have in VAMIX.

Possible issues

The only known issue is where you insert a video with multiple audio streams already used as overlay cannot handle this. This may cause the system to fail. Do not worry, just restart VAMIX.jar again. This does mean you cannot use that file with the system.

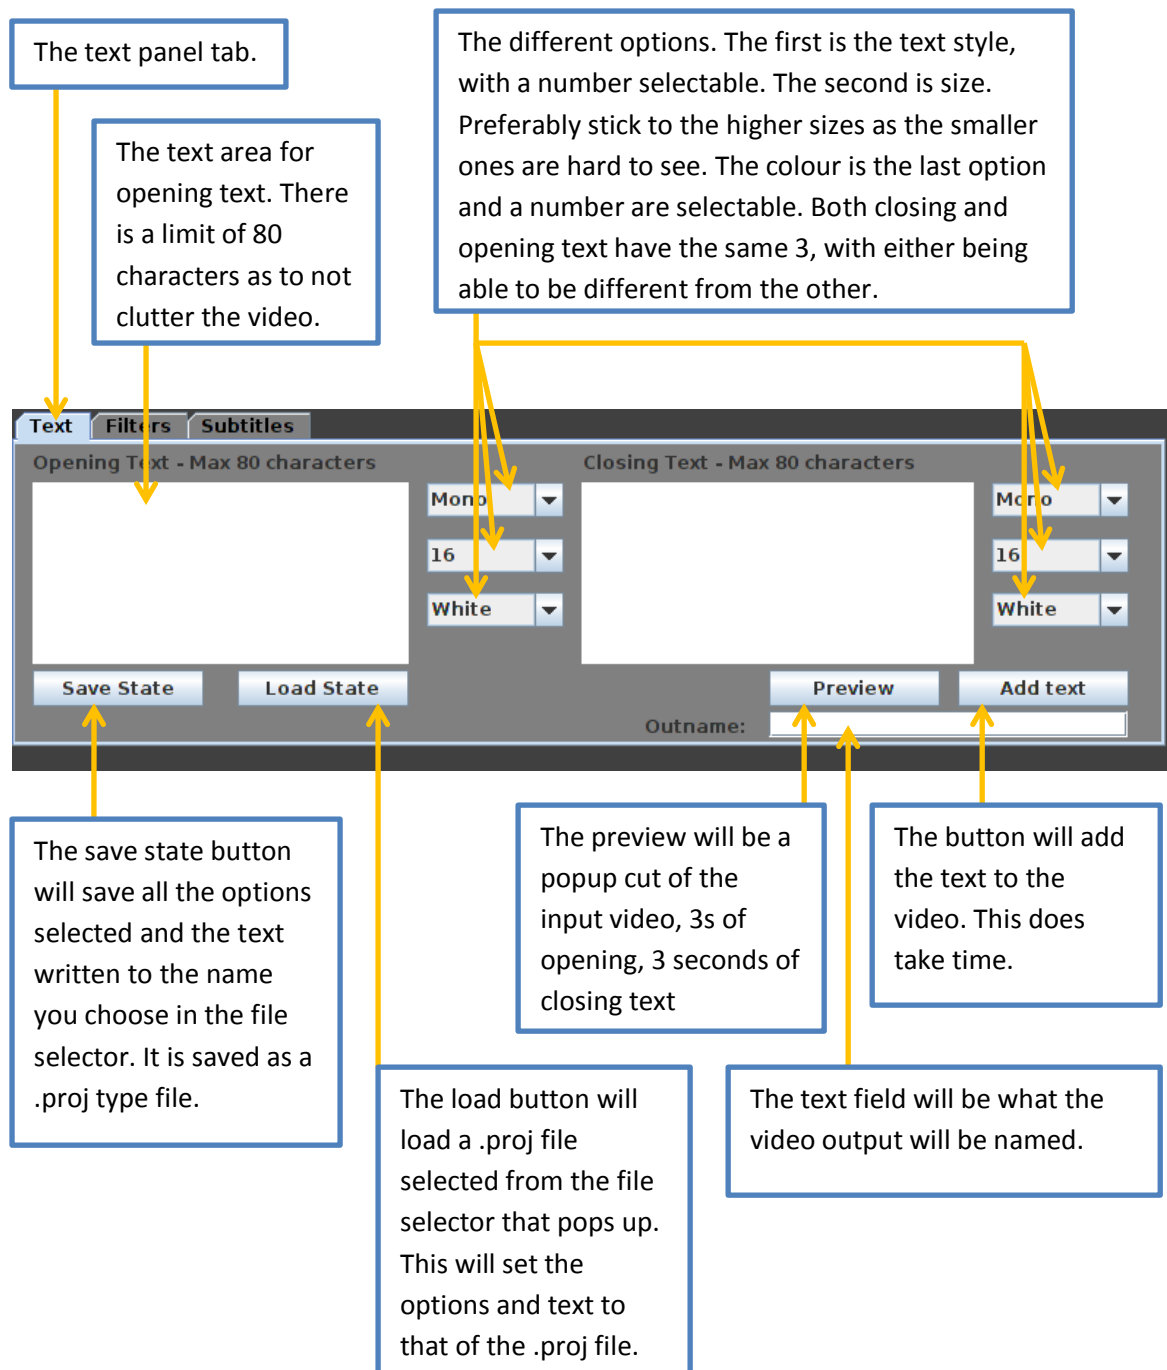

Text Panel

This panel is where you can add text to the video (at the beginning and end). This is for 10s at either end of the video. You may also choose from a selection of colours, types, and sizes. If you wish to save those settings, you can save them and load them back later if needed. This will be saved as a .proj file and you can select its location. You may also preview the text using the preview button.

Possible issues

You can only preview this text if you have entered text. The .proj does save the text entered so be careful what you have entered when you save the .proj file.

Filter Panel

This panel gives you use of a number of options to edit the video stream of the file. You can choose between trim (cuts out selected part of the file), flip (flips the video horizontally/vertically), and rotate (90,180,270 degree rotation only). You select one of the 3 tick boxes, and then enter an output name and the choice of options for the selected operation. After that, click generate to

Possible issues

If you input a from time higher than the to time, the system will ask you to enter a new time, same as if the two are equal. This is because you cannot start after the end of the desired time. The output name should also be unique; otherwise it will ask you whether you wish to overwrite the file names the same thing. You can create a file with the same name as the file in use unless it is also a .mp4 file. If it is .mp4 and the same name, it will let you know you cannot do the operation and to rename the output name.

The diagram illustrates the 'Filter Panel' interface, which is part of a software application. The panel has three tabs: 'Text', 'Filters' (which is selected), and 'Subtitles'. The 'Filters' tab contains three main sections: 'Trim', 'Flip', and 'Rotate'. Each section has a radio button to select it. The 'Trim' section has two input fields labeled 'From' and 'To', both with a value of '0'. The 'Flip' section has a dropdown menu currently set to 'Horizontal'. The 'Rotate' section has a dropdown menu currently set to '90'. Below these sections is an 'Output name:' label followed by a text input field. At the bottom right of the panel is a 'Generate' button. Six yellow arrows point from text boxes to specific elements in the interface: one to the 'Filters' tab, one to the 'Trim' radio button, one to the 'Flip' radio button, one to the 'Rotate' radio button, one to the 'Output name' text field, and one to the 'Generate' button.

The filters tab

The trim option. Selecting this will cut the video according to the times entered. This is using the From and To times, cutting both audio and video.

The flip option will flip the video depending on the option selected. This is either horizontally or vertically, which is different to rotating 180 degrees.

The output name is what the name of the file is to be called. This is checked, and will prompt you according to any issues.

The generate button will create the file using the output name, locking this panel from further use for the duration.

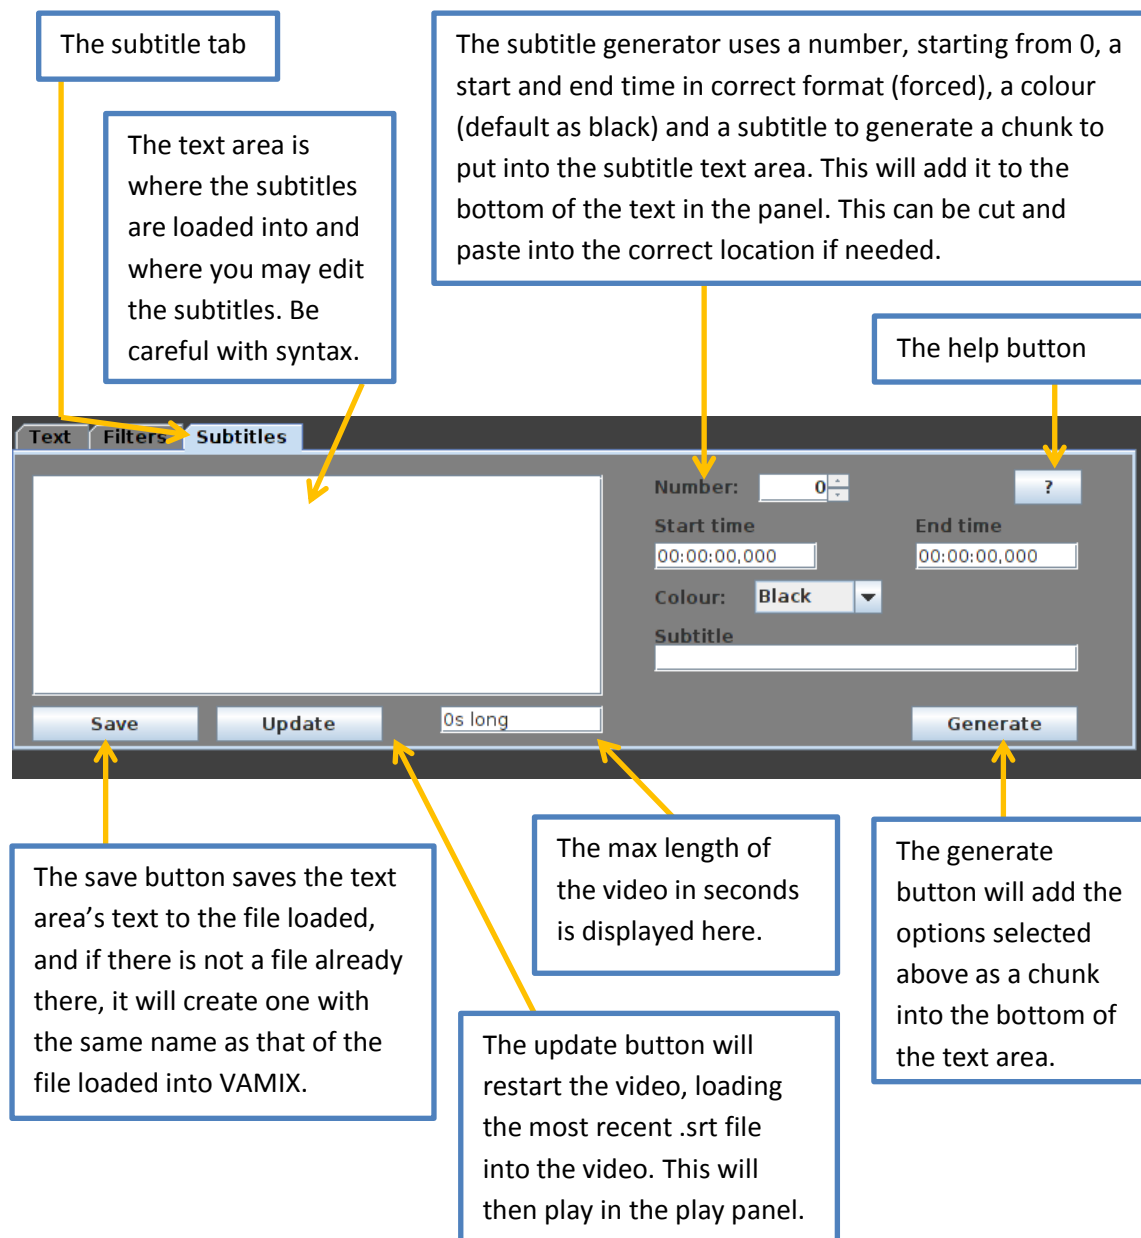

The rotate option will rotate the video depending on the option selected. This is either 90, 180 or 270 degree rotation, and will save to the output name that is selected.

Subtitle Panel

This panel controls subtitling for the system. The subtitle system uses .srt files with the same name as the video file in use. The system will load appropriate subtitles into the text area upon loading a video (if there is a .srt file for the video, it will load into the text area). This can then be edited manually, or you may use the generator on the right hand side of the panel to make the process simpler. There is a text field that tells you what the maximum time you should use is, and a help button that explains the basics of the subtitle system.

Possible issues

The file you create may not be perfect. This can mean that the file, when updated and run with the new subtitles, will not show everything you expected. Check the format and that the times are all correct for the file. The subtitles do not need to be in order, but it is preferable since it is easier for you to edit if needed. If all else fails and some things do not show up, try to redo them, and if it still does not work, try making the file again.

Extended section

If serious faults have occurred and it is unknown why from both the User Manual here, and the README.txt, then please email:

Logan.horton@live.com

Please structure your email as follows:

Date this occurred:

What happened:

What you believe caused the issue(s):

Your systems operating system (including add-ons):

Then please send the email and I will attempt to fix this issue and push out a fix.

Thank you.
